Development of entrustable professional activities for dental educators: a modified Delphi study

Noraini Abu Bakar^{1,2*}, Nurhanis Syazni Roslan^{3*}, Muhammad Saiful Bahri Yusoff⁴ and Mohamed Ibrahim Abu Hassan⁵

Abstract

Background There is a growing need for Entrustable Professional Activities (EPAs) specifically tailored to health professions educators including dental educators, whose responsibilities extend well beyond clinical expertise. Despite the breadth and complexity of these responsibilities, the current literature lacks EPA frameworks that are explicitly designed to reflect the unique and multifaceted scope of practice of dental educators.

Objective The objective of this Modified Delphi study was to develop a validated and consensus-based set of EPAs for dental educators.

Methods A three-stage consensus-building approach was employed in this study: (1) identification of existing EPAs in the literature through a systematic scoping review; (2) two rounds of a Modified Delphi exercise conducted via online questionnaires; and (3) a final in-person consensus focus group discussion to refine and finalise the list of EPAs. A total of 40 EPAs were systematically identified through a scoping review of the literature. These EPAs were subsequently evaluated by a panel of 10 experts using a three-stage modified Delphi technique. Consensus was quantitatively define as median rating of ≥ 3 on a 4-point Likert scale, with an item-level Content Validity Index (i-CVI) of ≥ 0.8 . Open ended responses were thematically analysed.

Results In the first round, consensus was reached to eliminate 6 EPAs, 7 EPAs further consolidated to 2 EPAs, 12 EPAs were revised and 15 EPAs were accepted without revision. In the second round, a total of 81 EPAs, comprising 29 retained from the first round and 52 newly suggested EPAs, were reviewed. Consensus was reached to exclude 1 EPA. By the end of Round 2, 80 EPAs were brought forward to the third round, which was conducted as in-person focus group meeting. The final round resulted in the elimination of 6 EPAs and the consolidation of 9 EPAs into 3, culminating in the endorsement of 68 EPAs, which were systematically organized into 12 distinct domains.

Conclusions This study successfully developed a validated and consensus-based set of 68 EPAs tailored for dental educators, addressing a critical gap in the current literature. This set provides a foundational tool to guide professional development, performance assessment, and role definition of dental educator.

Keywords Entrustable professional activities, Dental educator, Modified delphi

Background

Entrustable Professional Activities (EPAs) have emerged as a valuable framework in health-based education, effectively bridging the gap between competency frameworks and practical tasks [1–3]. Introduced by ten Cate in 2005, EPAs are defined as key professional tasks or responsibilities that individuals can be entrusted to carry out independently once they have demonstrated sufficient competence [2]. They were developed in response to the challenges associated with translating broad competency frameworks into day-to-day clinical and educational practice, thereby serving as a vital link between theoretical competencies and real-world professional duties [4, 5]

While the concept of EPAs has been widely applied in clinical training and health professions education, their adaptation for academic roles, dentistry included, has been largely overlooked. To date, the application of competency-based EPAs has predominantly focused on assessing students [6–9]. There remains a notable gap in their utilisation for evaluating the competence of educators themselves.

This highlights a significant shortcoming, considering the increasingly complex and multifaceted roles of dental educators. They are tasked not only with delivering clinical training but also with curriculum design, assessment, student mentoring, research and academic leadership [10]. However, current competency frameworks do not comprehensively capture the breadth and complexity of these responsibilities. As a result, there is an urgent need for EPAs specifically tailored to health-based educators, including dental educators, whose roles extend well beyond clinical expertise. This emphasizes the necessity for structured tools, such as educator-specific EPAs, to enable transparent, competency-based evaluation and professional development for faculty members.

By translating these broad responsibilities into clearly articulated, observable, and assessable tasks, EPAs provide a common language for expectations in academic practice. They offer a practical and observable framework that defines the core tasks dental educators must be entrusted to perform independently. This facilitates clearer expectations, structured professional development, and more objective assessment of performance. Implementing EPAs for dental educators enhances quality assurance in teaching, fosters accountability, and promotes excellence in dental education by aligning educational tasks with institutional goals and learner needs.

The development of EPAs necessitates a systematic and evidence-informed approach to ensure they are firmly grounded in real-world practice and aligned with established competency frameworks. This study was undertaken with that objective in mind, to develop a set of EPAs specifically for dental educators that reflect the complexity of their roles and are informed by both literature and expert consensus. For clarity, a 'dental educator' is defined here as any individual engaged in teaching, supervising, or mentoring dental learners across academic or clinical settings, including roles such as clinical instructor, course director, postgraduate or PhD supervisor, or education scholar. Establishing this definition is essential, as it provides the foundation for interpreting the scope and relevance of the EPAs developed in this work.

Objectives

The objective of this three-round Modified Delphi study was to develop a validated and consensus-based set of EPAs for dental educators.

Methods

Study design

The Modified Delphi method is a structured group consensus technique that integrates evidence from literature, stakeholder input, and expert judgment to achieve agreement on a given topic. It is particularly valuable in contexts where empirical evidence is limited, as it harnesses the collective intelligence of a panel of experts. This collaborative process is designed to produce outcomes that are more robust and valid than those derived from individual input alone, thereby enhancing the content validity of the findings [11, 12]. In light of the limited published work on EPAs specifically for dental educators, Modified Delphi technique was selected as methodological approach for this study as it was considered the most suitable for generating expert consensus and developing a robust, context-specific framework.

The CREDES (Conducting and Reporting of Delphi Studies) guidelines were employed as the methodological and reporting framework for this Delphi study to enhance its transparency, quality, and reproducibility [13].

A three-stage consensus-building approach was employed in this study: [1] identification of existing EPAs in the literature through a systematic scoping review (15th October 2024 till 23rd Feb 2025); [2] two rounds of a Modified Delphi exercise conducted via online questionnaires (First Round:17th till 31st March 2025, Second Round:15th April till 29th April 2025); and [3] a final in-person consensus focus group discussion to refine and finalise the list of EPAs (4th till 7th May 2025).

Abu Bakar et al. BMC Medical Education (2025) 25:1699 Page 3 of 29

Stage 1: scoping reviewStage 1 should be in Section 2

Addressing the research question- What are the elements of EPAs for dental educators, as described in the literature? - the review adhered to the Joanna Briggs Institute scoping review framework and the Preferred Reporting Items for Systematic reviews and Meta-Analyses for Scoping Reviews methodology (PRISMA-ScR) with four [4] reviewers [14]. Employing a rigorous three-step search strategy across five electronic databases (PubMed, Google Scholar, Scopus, Cochrane Library and Pro-Quest), the review includes articles published between January 1, 2005 and October 1, 2024 with eligibility criteria targeted papers published in English with keywords/ Search term ("Entrusted Professional Activities" OR "Entrustable Professional Activities" OR "Entrustable profession* activit*") AND ("Dental Educator*" OR "Dental Education" OR Dentistry).

The results were summarized, coded and thematically categorized and mapped to existing competency for dental educators.

Protocol Registration The protocol have been published in JMIR Research Protocols https://doi.org/10.219 6/74225 [15].

Stage 2: two rounds of online Consensus-Building using the modified Delphi method

Panel selection criteria for the modified Delphi study

A total of ten [10] expert panellists were recruited for the Modified Delphi process using purposive sampling. Informed consent to participate was obtained from all of the participants in the study. Selection was guided by predefined inclusion criteria, as stated below, to ensure relevant expertise, experience, and diversity among participants:

1. Expertise in Dental Education or Clinical Specialties Experts were required to possess formal postgraduate qualifications in a clinical dental specialty or in dental/medical education. Additionally, participants were expected to have demonstrated substantial engagement in curriculum development, teaching, or assessment activities within undergraduate or postgraduate dental education programmes.

2. Academic and Professional Experience

Eligible participants included senior educators with a minimum of five years of experience in academic or clinical teaching following the completion of their specialty or doctoral training. Preference was accorded to individuals in senior academic roles such as Deans, Deputy Deans, Heads of Department, or Programme Coordinators, given their strategic involvement in faculty development and educator evaluation, which enables them to contribute critical and informed perspectives to the study.

3. Representation and Diversity

Efforts were made to ensure representation across a range of clinical disciplines, including but not limited to Orthodontics, Restorative Dentistry, and Oral and Maxillofacial Pathology (OMOP). Furthermore, panellists were selected from both public and private dental institutions throughout Malaysia to promote geographical and institutional diversity.

4. Willingness to Participate

All panellists were required to demonstrate a willingness and ability to participate in all rounds of the Delphi process. This included providing quantitative ratings and qualitative justifications or feedback throughout the study.

Questionnaire with 4 likert scale with open ended questions

The questionnaire was designed to evaluate each EPA based on four key characteristics adapted from the framework applied by Bruggen et al. 2022: clarity, relevance, comprehensiveness, and usefulness [14]. These dimensions were chosen to ensure each EPA was not only well-defined and applicable but also complete and valuable for practical implementation. A total of 40 items were included in the questionnaire, derived from the findings of the preceding scoping review.

Panel members were asked to rate each EPA using a 4-point Likert scale (1 = Strongly Disagree; 2 = Disagree; 3 = Agree; 4 = Strongly Agree). The use of a 4-point scale is advantageous as it eliminates neutral response options, thereby encouraging panellists to take a definitive stance. This approach facilitates a clearer distinction between agreement and disagreement, supporting more efficient identification of consensus among the panel members.

Open-ended questions were included to allow participants to provide qualitative feedback, suggest rewording or improvements, identify redundancies, or propose additional EPAs. This combination of quantitative and qualitative input ensured a comprehensive evaluation and supported the refinement of the EPA list through expert consensus.

Briefing for the panel of experts

To support panellists' understanding of the EPA concept while accommodating their busy schedules, an orientation component via video-recorded PowerPoint slides was incorporated. This material provided a comprehensive briefing of the EPA framework, including definitions, examples, and a specification template to assist participants in distinguishing EPAs from competencies. Additionally, the slides outlined the study objectives, methodology, and detailed the actions required for each round. Panel members were also offered the opportunity to contact the research team directly for any further clarification or assistance throughout the study process.

Abu Bakar et al. BMC Medical Education (2025) 25:1699 Page 4 of 29

Analysis tool

The study results were quantitatively analysed using IBM SPSS Version 29.0 based on predefined consensus criteria. In parallel, the open-ended responses were thematically analysed via NVivo software to identify emerging patterns and insights, ensuring a comprehensive understanding of both numerical trends and qualitative feedback.

Consensus criteria

Consensus was defined as a median rating of ≥ 3 on a 4-point scale, with at least 80% agreement of ratings of 3 or 4 (Agree or Strongly Agree) and an item-level content validity index (i-CVI) of ≥ 0.8 . Median was chosen as it ensures central tendency in ordinal data like Likert scale, which reflect the agreement. Median is also more stable and resistant to skewing from extreme rating for small sample size of 10 panel.

Stage 3: A final in-person consensus focus group discussion

To ensure high-quality feedback, the third round was conducted through three separate focus group discussions - two held face-to-face and one conducted online. Each session comprised 3 to 4 panel members and lasted an average of approximately 90 min. All sessions were audio-recorded, verbatim transcribed using TurboScribe, and subsequently analysed to extract consensus points and identify key thematic insights. Transcription and code validated by researchers team for analytic rigor.

Results

Scoping review

The review ultimately scoped five (5) from 1,632 articles that desConsensus and Scale-Level content validity indicescribed a total of forty-three (43) EPAs. Seven (7) of these EPAs were found to overlap; therefore, they were consolidated to four (4) EPA statements following a consensus, resulting in a total of 40 final EPA statements as shown in Table 1. The review yielded seven (7) themes via NVivo software: Teaching; with five EPAs, Bedside Teaching; with seven EPAs, Surgical Teaching skills; with 7 EPAs, Mentoring and coaching; with two EPAs, Research and scholarships; with eight EPAs, Educational development; with seven EPAs and Assessment; with four EPAs. The full results of the scoping are published in BMC Medical Education https://doi.org/10.1186/s129 09-025-07888-z [16].

Modified Delphi expert panel demographic

A purposive sample of 10 experts participated in the Delphi process. The panel comprised experienced dental educators with diverse professional backgrounds, many of whom held senior academic or administrative positions, including dean, deputy dean, and head of

department or programme. The mean age of participants was 52.1 years (range: 45–72), with a median of 18.5 years of professional experience following their specialty qualification. The panel represented a broad mix of dental academic faculties across Malaysia, encompassing various clinical specialties. Table of demographic of the experts is as shown in Table 2.

EPA development process

The EPA development process is illustrated in the infographic below, providing a visual representation of the structured, multi-stage methodology employed in this study together with the outcome (Fig. 1).

Round 1 results

In the first round of the Delphi study, a total of 40 EPAs were evaluated by the expert panel. All ten panel members responded, yielding a 100% participation rate. Six (6) EPA were eliminated as they did not meet the predetermined thresholds (a median rating of \geq 3 on a 4-point scale, with at least 80% agreement (ratings of 3 or 4) and an item-level content validity index (i-CVI) of ≥ 0.8). Seven EPAs (marked by Ω) were identified by panel as having overlapping content and were consolidated into two comprehensive EPAs to minimize redundancy. Twelve EPAs were revised to enhance their wording, clarity, or scope based on the panel's suggestions. Fifteen EPAs were accepted without any changes. In addition, the open ended section of Round 1 generated 52 new EPAs suggestion from the panel. These responses were thematically analysed using NVivo, with multiple discussions held among the research team to ensure transparency, rigor, and data triangulation. As a result, the 52 newly proposed EPAs, together with the 29 refined EPAs from Version 1.0, were carried forward to Round 2 for further evaluation and consensus-building. These 81 EPAs were categorised according to the domains of competencies for dental educators as outlined by Chuenjitwongsa et al. (2018) [20].

Details of the quantitative analysis from Round 1 are presented in Table 3, while the combined qualitative and quantitative consensus findings are summarized in Table 4. The updated list of the outcome of Round 1, representing EPA Version 2.0, is illustrated in Table 5.

Round 2 results

In the second round of the Delphi study, a total of 81 EPAs were evaluated by the expert panel. All ten panel members participated, maintaining a 100% response rate. One (1) EPA was eliminated for not meeting the predetermined criteria (median score < 3 and/or item-level content validity index [i-CVI] < 0.8). The open-ended section of Round 2 generated very limited comments with no new suggestions of EPA.

Abu Bakar et al. BMC Medical Education (2025) 25:1699 Page 5 of 29

Table 1 The EPA version 1.0 from the scoping review. The Forty (40) EPAs were grouped into the seven (7) themes

THEME	No	EPA
Teaching	1	Lecturing[14]
	2	*Individual or small group teaching [4, 14]
	3	Large group teaching [4]
	4	Teaching lab classes and skills education [14]

	31	Developing a curriculum blueprint [17]
	32	Instructional design for a variety of teaching and learning contexts [17]
	33	Designing, applying and revising educational quality assurance [17]
	34	Designing and implementing faculty development [17]
	35	Leading strategic education projects and policy developments[17]
	36	Designing and developing a course [14]
Assessment	37	Assessing written work of students [14]
	38	Developing and administrating tests and establishing results [14]
	39	Assessment of trainee proficiency [4]
	40	Designing, applying and revising student assessment systems [17]

^{*}Merged and consolidated.

Details of the quantitative analysis from Round 2 are presented in Table 6, while the integrated consensus are summarized in Table 7. The updated list of the outcome of Round 2, representing EPA Version 3.0, is illustrated in Supplementary Table I.

Round 3

In the third round of the Delphi study, a total of 80 EPAs were evaluated by the expert panel. All ten panel members participated, maintaining a 100% response rate. This round was conducted through a two (2) face-to-face and

one (1) online focus group discussion, which resulted in the following agreements:

- 1. Consolidation of 9 EPAs into 3 EPAs, as detailed in Table 8.
- 2. Elimination of 6 EPAs, as shown in Table 9.
- 3. Rearrangement of EPAs within domains to improve the logical flow and alignment of activities.
- 4. Relocation of one EPA to a different domain to better reflect its scope (EPA: Developing Study

Plan from domain Educational Management to Curriculum Matters).

5. Refinement of some action verbs to enhance clarity and alignment with expected levels of performance.

- 6. The name of one domain was revised from "Mode of Education" to "Educational Practices" to better reflect the breadth and nature of tasks encompassed within this category.
- 7. Rearrangement of the domain sequence to reflect the progressive development of an educator.

The final list, representing EPA Version 4.0, consists of 68 EPAs and is shown in Table 10.

Discussion

Interpretation of findings

The findings from this three-round Modified Delphi process contribute meaningfully to this underdeveloped area by outlining EPAs that reflect the full breadth of responsibilities expected of modern dental educators.

The high level of engagement across all three-stage (100% response rate) underscores the perceived importance of this initiative among experts. In the first round, the structured use of a 4-point Likert scale and i-CVI helped ensure that only EPAs meeting minimum thresholds for relevance and clarity were retained or revised. A median \geq 3 reflects central agreement, while \geq 80% agreement indicates majority support. The panel's qualitative input was equally valuable, leading to the generation of 52 additional EPAs. This highlights the richness of expert experience and the need for a methodology that accommodates both quantitative scoring and narrative insights.

By Round 3, the process resulted in a final list of 68 EPAs, reflecting both consolidation and refinement across the rounds. Importantly, the panel's decisions to rearrange EPAs within domains, shift an EPA across domains, and improve action verbs demonstrate that expert consensus was not limited to content validation but also extended to structural and semantic clarity—key to the real-world utility of EPAs.

Organising the final EPAs into 12 domains reflects the multidimensional role of dental educators. This holistic representation is consistent with contemporary views on faculty development and academic performance, aligning with broader competency-based medical and dental education frameworks [10, 21].

Overall, the study supports the feasibility and value of using a Modified Delphi approach to develop EPAs and offers a replicable model for other health professions education fields. The EPAs developed here provide a foundation for professional development, accountability, and evaluation in academic dentistry, while also supporting alignment with institutional expectations and accreditation standards.

Implications for dental educators

The implementation of a structured EPA framework can positively impact dental educators.

Abu Bakar et al. BMC Medical Education (2025) 25:1699 Page 7 of 29

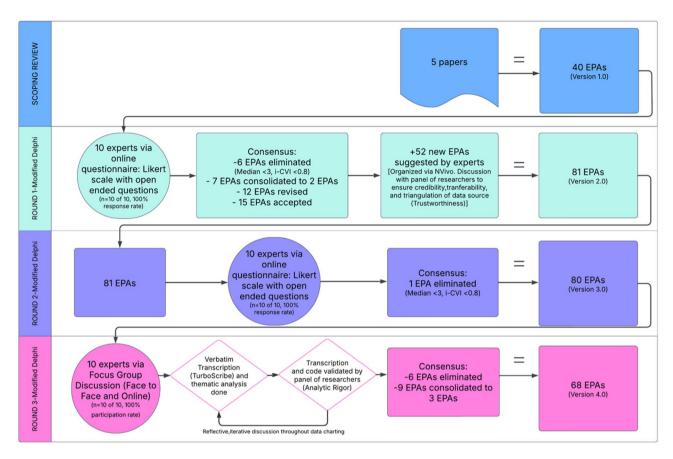

Fig. 1 Infographic summarising the structured process used to develop Entrustable Professional Activities (EPAs) for dental educators in this study. The process involved three key stages: a scoping review to generate initial items, two rounds of a Modified Delphi survey with expert panellists, and a final in-person focus group consensus meeting

Firstly, EPAs help standardise performance expectations, ensuring that dental educators across institutions understand the core tasks they are expected to master and be entrusted with. This facilitates transparent evaluation, allowing for consistent and objective assessment of educator performance in both formative and summative contexts.

Secondly, EPAs support faculty development by identifying specific areas of responsibility that can be aligned with individual growth plans, training programs, and institutional goals. They offer a clear pathway for professional progression, helping educators and administrators track development over time.

Thirdly, EPAs enable better alignment between educational responsibilities and institutional accreditation standards, thereby enhancing accountability and quality assurance. By anchoring responsibilities to observable activities, EPAs also foster trust and autonomy, reinforcing confidence in educators' capabilities.

Lastly, the implementation of EPAs encourages a competency-based culture in academic dentistry, promoting

reflective practice, peer support, and continuous improvement. In sum, EPAs empower dental educators by making their contributions visible, measurable, and developmentally supported.

Strength and innovations

This study has several notable strengths. First, it employed a rigorous and systematic combined methodologies - a scoping review plus a Modified Delphi methodology which adhered to all 16 points of CREDES guideline [13]. The combination of both quantitative and qualitative approaches ensures robust consensus-building among a diverse panel of experts. The use of multiple rounds, including a final in-person focus group discussion, allowed for in-depth clarification, refinement, and validation of each EPA. Second, the study achieved a 100% response rate across all three-stages, reflecting strong engagement and commitment from the expert panel, which enhances the credibility and reliability of the findings. Third, the incorporation of open-ended feedback and thematic analysis enriched the

with at least 80% agreement (ratings of 3 or 4) and an item-level content validity index (i-CVI) of \geq 0.8. Six (6) EPAs were removed in round 1 for not meeting the consensus criteria; **Table 3** Summary of quantitative analysis of the round 1 EPA Ratings, consensus Status, and items Removed. consensus was defined as a median rating of ≥ 3 on a 4-point scale, these are marked in bold with asterisks (*)

Table 3 (continued)

data, ensuring that the final EPA framework was both evidence-informed and contextually relevant. Lastly, the study addresses a significant gap in the literature by developing the first comprehensive EPA framework tailored specifically for dental educators. It offers a practical tool that aligns with competencies outlined by Chuenjitwongsa et al. 2018 [20]. It also demonstrates potential alignment with established standards such as Malaysian Qualifying Agency (MQA) in Area 4: Academic Staff and Area 7: Programme Monitoring and Continuous Quality Improvement, COPDEND (UK) [10], CODA (USA), and CanMEDS (Canada), thereby enhancing its relevance and applicability across various educational and regulatory contexts.

Limitations

Translation to practicality

This study presents a novel application of EPAs by focusing on educators rather than learners. While this conceptual extension is innovative, it remains at an early stage, and further work is required to fully establish effective assessment methods for these EPAs in practice. Specifically, there is a need for a detailed elaboration of the knowledge, skills, and attitudes that underpin each EPA, as well as mechanisms for evaluating their performance. Given that EPAs for educators may differ in scope, structure, and purpose from those traditionally designed for learners, additional refinement and adaptation are necessary. Addressing these aspects presents valuable opportunities to enhance the framework's relevance and strengthen its applicability in faculty development and assessment.

The argument of the use of the modified Delphi technique

The development of EPAs for educators is inherently exploratory and necessitates input from individuals with first-hand experience in dental education roles. In contexts where empirical data or objective benchmarks are limited, the Delphi method offers a structured and transparent means of capturing expert perspectives, iteratively refining them, and arriving at a shared framework.

We acknowledge that consensus-building approaches, such as the Delphi are not without limitations, particularly concerning the epistemic challenges of defining "expertise" and the validity of consensus as a decision-making process. It is valid to acknowledge that consensus in science does not always equate to truth. However, in the field of medical education, consensus methods have been widely and productively used to develop frameworks, competencies, and assessment tools (e.g., Can-MEDS and ACGME competencies). In these applications, consensus serve as an essential starting point for operationalizing complex constructs, which can subsequently be piloted, tested, and refined in real-world settings.

Table 4 Consensus and Scale-Level content validity indices of EPA ratings for Delphi round 1. This table summarizes the outcomes of the first Delphi round: 6 EPAs were eliminated (marked in bold), 7 EPAs (indicated by Ω) were consolidated into 2 streamlined EPAs, 12 EPAs were revised based on expert feedback, and 15 EPAs were accepted without modification. S-CVI/Ave = average of all I-CVI values across the scale; threshold for validity of > 0.80 is considered acceptable for good content validity. S-CVI/UA = proportion of items with universal agreement

THEME	NO	ЕРА	CONSENSUS	REVISED EPA	S-CVI Av	S-CVI/ UA

Table 6 Summary of quantitative analysis of the round 2 EPA Ratings, consensus Status, and items Removed. consensus was defined as a median rating of ≥3 on a 4-point scale, with at least 80% agreement (ratings of 3 or 4) and an item-level content validity index (i-CVI) of ≥ 0.8. One EPA(No.60) were removed in round 2 for not meeting the consensus

Table 7 Consensus and Scale-Level content validity indices of EPA ratings for Delphi round 2. This table summarizes the outcomes of the second Delphi round: 1 EPA was eliminated (marked in bold). S-CVI/Ave = average of all I-CVI values across the scale; threshold for validity of > 0.80 is considered acceptable for good content validity. S-CVI/UA = proportion of items with universal agreement

DOMAIN OF COMPETENCES	EPA	Consensus	S-CVI/Ave	S-CV UA

Table 8 EPA consolidated in round 3 (9EPAs to 3EPAs)

NO	EPA	Consolidated to:
12	Conducting Bedside/Chairside Teaching	Teaching in clinical setting
13	Planning Bedside/Chairside Teaching	
14	Conducting Bedside/Chairside Teaching Assessment	
15	Evaluating Bedside/Chairside Teaching	
16	Learner Centered Bedside/Chairside Teaching	
47	Supporting Learner Growth and Professional Well Being	Supporting Learner Growth and professional
50	Identifying and Customizing Educational Support for Marginalized Students	well-being (including marginalised and underserved student)
54	Understanding Accreditation and Compliance Management	Understanding Accreditation and Compliance
55	Understanding the Requirements of the National Quality Assurance and regulatory bodies	Management of regulatory bodies

Table 9 6 FPAs eliminated in round 3

NO	EPA	Main reason for elimination	Quotes
37	Understanding De-briefing technique	Overlapped with EPA Reflection	[P4]: Reflection is the things that are more familiar in our field. Reflection and giving feedback that is more simple terms to be used rather than debriefing technique.
40	Understanding methods of evaluation to the principles educational programme	Overlapped with Domain 1	[P3]: Because when you talk already earlier in domain 1, they should know understanding of everything, isn't it? Principles and
51	Monitoring of student's behavioural change	Not readily attainable by all dental educators/ Implementation issue	[P1]: Not all mentor can pick up the behaviour change also. The challenge would be on the implementation part. Importance is there but the implementation part is challenging. [P3]: Yeah. Again. Because (EPA47) might encompass the professional well-being of the students.
53	Designing, applying and revising educational quality assurance	Overlapped with EPA 56 "Involvement in insti- tutional and Faculty Development for Quality Assurance"	[P4]: Repetition of 56
63	Respecting and Maintaining Professional Boundaries	Overlapped with EPA 61"Demonstrating Ethical and Professional Conduct"	[P3]: 61 and 63, how does it differs? [P5]: Yeah, I would say the same. [P3]: So, you can just keep 61 rather than having the 63.
77	Conducting and publishing litera- ture reviews	Can be inclusive in EPA75 "Conducting qualitative/quantitative/mixed mode/consensus research"	[P3]: You don't need to be very specific to literature review alone. One should understand that literature comes together with the research.

Future directions

Following the development of this consensus-based EPA framework for dental educators, the next essential step will be to pilot the EPAs in real-world academic settings. This phase will facilitate the evaluation of their applicability, feasibility, sensitivity, and specificity in assessing educator performance, while also providing insights into their effectiveness in distinguishing between different levels of competence and guiding entrustment decisions. Piloting will further enable the translation of the EPA framework into a structured assessment scheme, incorporating refined performance descriptors and thresholds

to support both formative and summative evaluations of academic roles and responsibilities. While the identification of 68 EPAs represents a comprehensive starting point, it may also pose challenges for governance, including rater training and portfolio management. Therefore, pilot testing will be critical to assess practicality. This process will further clarify whether the EPAs should function as a universal set or be organized into role-based tracks or subsets, ultimately supporting the development of a streamlined 'core' EPA set with optional, locally adaptable extensions, enabling programs to envision feasible implementation strategies.

Table 10 EPA version 4.0 – Final outcome of the modified Delphi technique outlining 68 EPAs consolidated in 12 domains of competencies for dental educators

	ERSION 4.0		
DOMAIN NO	DOMAIN OF COMPETENCES	EPA NO	EPA .
1	Educational Theories and Principles	1	Comprehend various contemporary teaching and learning methods (Lectures, PBL, practical, clinical, online, reflection)
	(8)	2	Comprehend teaching pedagogy
		3	Comprehend student centred learning
		4	Comprehend outcome-based education
		5	Comprehend competency-based education
		6	Comprehend various learning styles: visual, auditory, reading/writing and kinaesthetic (VARK/KOLB's)
		7	Comprehend mentoring and coaching
		8	Be familiar with digital or internet-mediated learning
2	Educational Prac-	9	Lecturing

		68	Practicing good team-work

Conclusion

This study successfully developed a validated and consensus-based set of 68 EPAs tailored for dental educators, addressing a critical gap in the current literature. Through structured, three-round Modified Delphi process of iterative expert input and thematic analysis, the final EPA framework was developed to reflect the complex and multifaceted roles of dental educators across diverse domains. This validated set of EPAs serves as a foundational tool to support professional development, performance assessment, and role clarification within academic dental institutions.

Supplementary Information

The online version contains supplementary material available at https://doi.org/10.1186/s12909-025-08119-1.

Supplementary Material 1.

Acknowledgements

The authors gratefully acknowledge the Tom Bereznicki Dental Education Grant from the Royal College of Surgeons of Edinburgh, which supported the first author's course of study. The authors also extend their sincere appreciation to the ten expert panel members for their invaluable contributions, generous support, and active participation, all of which were instrumental to the successful completion of this study.

Authors' contributions

NAB conducted the initial research, which was reviewed by all co-authors (MSBY, NSR, and MIAH). All authors were actively involved in the discussions and execution of the three rounds of the Modified Delphi Technique. These discussions ensured the rigor and triangulation of the data. The manuscript was primarily authored by NAB, with MSBY, NSR, and MIAH providing critical oversight and guidance throughout the writing process. The final version of the manuscript was reviewed, commented on, and approved by all authors prior to submission.

Funding

This paper received no specific grant from any funding agency in the public, commercial or not-for-profit sectors.

Data availability

Supplementary files included.

Declarations

Ethics approval and consent to participate

This study received ethical approval from the Human Research Ethics Committee of Universiti Sains Malaysia (HREC), under the reference code: USM/JEPeM/KK/24030224 and adhered to the Declaration of Helsinki.

Consent for publication

Not applicable.

Competing interests

The authors declare no competing interests.
