ABSTRACT

Emergency and guidance systems are very important in our lives. Although such systems were developed and used for a long time, they still suffer from weaknesses in terms of their functionalities and the technology used, especially in communication. To overcome the existing problems, this paper proposes an integrated approach to emergency and guidance using the latest broadband wireless technology (WiMAX). This system can provide: Live audio and video coverage of emergency situations, Automatic pre-recorded Short Message Services (SMS) and Multimedia Message Services (MMS) to all relevant emergency services, site-location and intelligent route-guidance to destinations, automatic access to all relevant information about emergency victims, easy adaptability and portability for use in a number of different occasions at different locations, can cover a wide area, and provides security and flexibility. A simulator for this system is currently under construction.

Keywords: Emergency System, Intelligent Guidance, WiMAX, Wireless Broadband.

1. EMERGENCY AND GUIDANCE SYSTEMS

An Emergency is "any event that arises in an environment having the potential to adversely affect the health or safety of persons and valuables in the area and requires immediate response by them" [1]. An emergency system reduces the risk of an emergency case to the health and safety of persons and valuables by providing an effective means of communication with relevant authorities, safety guidelines and measures to be taken in an emergency situation [2]. These systems normally rely on the existing telephone and other communications infrastructure via operators and service personnel; therefore they suffer from the following drawbacks:

- In many emergency situations, communications and wireless networks can become overloaded and many calls may not be completed.
- Emergency systems are typically built for people who are familiar with the given environment and know how to behave under each particular situation;
- Communication with emergency response authorities normally relies upon a prior knowledge of the contact telephone numbers and an ability to communicate and effectively describe the location to the emergency personnel on duty.
- They are also a connection-oriented form of communication where the person reporting the emergency has to wait for a response before passing on the message.

Guidance means 'to direct in a course or show the way to be followed' [3] It implies an intimate knowledge of the way and all its difficulties and dangers. Guidance Systems today provide a means of: allowing people to stay in touch with events; access available educational, leisure and recreational facilities in an unfamiliar environment and be able to trace their ways back to their destinations such as hotels, conference halls or places of residence, with relative ease.
