1. Evan's Model for Collection Development

Basri Hassan, Ruhill Fahima Mohammad, Ahmad Bakeri Abu Bakar
Department of Library and Information Science, Faculty of Information and
Communication Technology, International Islamic University Malaysia,
Malaysia

ABSTRACT
The model proposed by Evans consists of six elements in collection
development activities which are community analysis, collection
development policy, selection, acquisition, de-selection, and evaluation. The
process of collection development is not confined to those issues related to
acquisition but its scope also covers the elements of weeding or deselection.
Compared to others Evan's model is more encompassing and well structured.

1.1 INTRODUCTION
Another theoretical method of the collection development was proposed by
Evans (1995) whereby he underlines every major component in the collection
development process. He outlined six major components involved in the
process of collection development. These six components are formed in a
cyclical order that begins with the: i) community analysis, ii) selection
policies, iii) selection, iv) acquisition, v) weeding, and vi) evaluation. Thus
through the series of these components, collection development is entailed a
constant cycle that continues as long as the institution exist (Refer to Figure
1.1).
