ABSTRACT

In this project, was developed a solubilization method of vitamin E in DMEM (Dulbecco modified Eagle's minimal essential medium) culture medium in order to attain higher concentration absorbance of vitamin E. There are two method which are conventional and evaporation methods. Vitamin E plays an important role in prevention of chronic disease. Furthermore, we will compare and contrast conventional and evaporation method for solubilization of vitamin E in culture medium. Cellular uptake, antioxidative as well as possible prooxidant activities of vitamin E in DMEM medium was determined under a wide range of their concentration. The aspect that concerned in this project is the optimum process condition to yield the highest concentrations of vitamin E. The process conditions in this project are the concentration of Tetrahydrofuran (THF) and concentration of vitamin E where the function of THF is to enhance the solubilization. The Design Expert software with Central Composite Design was used in this project for the optimization purpose and analyzes the antioxidant activity. Evaporation performed the best method compare to the conventional method due to the higher antioxidant activity. The percentage is 97.5% when use 60µM and 6% of THF.

Keywords: Vitamin E, solubilization, DMEM, cellular uptake.

INTRODUCTION

Dietary antioxidants are substances in foods that significantly decrease the adverse effects of reactive oxygen species, reactive nitrogen species, or both on normal physiological function in humans. Mostly found in fruits and vegetables, they, prevent free radicals from attacking cells and damaging DNA. Epidemiological evidences have suggested that intake of fruits and vegetables reduce the risk of both cancer and cardiovascular disease. (Dutta et al., 2003). Flavonoids, carotenoids, vitamin C, vitamin E and selenium are the major dietary antioxidant.

Vitamin E’s function as an antioxidant is dependent upon its ability to break radical-propagated chain reactions. As a result, the formation of the tocopheroxyl radical, the odd-electron derivative of vitamin E, is an inherent part of any vitamin E based, antioxidative
