Introduction 1

Chapter 1 Al-Majusi Contribution in the Understanding of the Cardiovascular System and Blood Circulation 3
Chapter 2 Al-Majusi: The Pioneer in Obstetrics 7
Chapter 3 Al-Razi Works and Contributions in Neurological Sciences 12
Chapter 4 Ar-Razi on Gout 19
Chapter 5 Ali Bin Isa Al-Kahhal: Pioneer in Ophthalmology 25
Chapter 6 Al-Majusi’s Treatment of Physical Diseases Using Drug Therapy and Surgical Manipulation 30
Chapter 7 Al-Razi’s Understanding and Curing of Smallpox and Measles 35
Chapter 8 Al-Razi’s Contribution to the Study of Nexus between Human Mind and Body 39
Chapter 9 Abu Zayd Ahmed Ibn Sahl Al-Balkhi on Medical Psychology 45
Chapter 10 Contributions of Ashraf Ali Thanwi to Mental Disease Treatment 49
Chapter 11 Ibn Zuhr on Diseases and Treatments 54
Chapter 12 Ibn Al-Jazzar on Fever 59
Chapter 13 Ibn Al-Khatib and his Theory of Contagion 64
Chapter 14 Ibn Al-Nafis Contribution in Urology Progress Practices 67
Chapter 15 Ibn Al-Quff on Preventive Medicine 72
Chapter 16 Ibn Sina on Aromatherapy 76
Chapter 17 Studies in Gynaecology in Zad Al-Musafir Wa Qut Al-Hadir of Abu Jaafar Ibn Al-Jazzar 81
Chapter 18 Contributions of Ibn-Sina in Pharmaceutical Sciences 88
Chapter 19 The Contribution of Ibn Al-Baitar in Medicine 94
Chapter 20 The Contribution of Saghir Akhtar in Pharmaceutical Science 99
Chapter 21 The Glorious Contribution of Ibn Al-Quff on Cardiology and Embryology as Well as Other Surgical Matters 104
Chapter 22 Success Journey of Mehmet Oz in Cardiothoracic Surgery 109
Chapter 23  Abu Al-Qasim Al-Zahrawi's Contribution to Neurosurgery  115
Chapter 24  Al-Zahrawi Method on Inflammatory Swellings and Tumours Surgery  120
Chapter 25  Oculist’s Contributions to Cataract Operation  126
Chapter 26  Al-Zahrawi Contribution to Medical Instruments  131
Chapter 27  Al-Zahrawi’s Explanation on Bone Fractures and Its Surgical and Non-Surgical Treatments  137
Chapter 28  Inhalation and Oral Anesthetics: Views of Selected Muslim Physicians  144
14.1 INTRODUCTION

The objective of this chapter is to explain about the progression of urology that had been made by Ibn al-Nafis, one of the well-known Muslim physicians. Urology is another branch of medicine that based on the treatment of disorders and diseases related to male and female genito-urinary organs including the kidney, ureters, bladder, prostate and genitalia. The significance of this study to highlight about urology study progress done by Ibn al-Nafis, where he made the progress based on Ibn Sina and Greek Galen’s work. The methods of findings were based on a collection of literature such as writing like journals, list or report and books as well.

14.2 THE HISTORY OF UROLOGIC KNOWLEDGE IN TIME OF IBN SINA AND GREEK GALEN

Up till now, out of this ongoing long-term research project, several original contributions to the progress of urology by scholars during the Medieval Islamic era have been documented (Abdel Halim, 1985, p.474). This includes contributions to the progress of anatomy, physiology, pathology, clinical urology, therapeutics, operative urology, and instrumentation. Ibn al-Nafis that lived around 1210-1280 was an arab physician who discovered pulmonary circulation of the blood and was also the one who wrote a commentary on the anatomy of the kidneys and bladder. Then, he made some progress about urology based on Ibn Sina and Greek Galen’s study.

Avicenna or Ibn Sina was an Iranian philosopher and physician of the 10th and 11th centuries and he was born in 980 AD in a village near Bokhara, a city in old Persia, and died in 1037 AD in Hamadan, Iran. He was most talented physician during his time and the most valuable contributions are in the fields of angelology (Meshkat, 2004, p.611) cardiology and treatment of kidney diseases (Al-Baba, 1984). One of his famous books called The Canon of Medicine has widely been used in the West and the subjects within it are similar to modern medical text books.

For instance, a 30-page chapter on examination of urine is similar to the Campbell-Walsh’s Textbook of Urology (Wein et al., 2007). In this book, it describes the collection of urine specimens, methods of examination and characteristics of urine such as color, turbidity, consistency, odor, sediments, volume and presence of foam. In addition, the book also examined the urine characteristics in healthy and sick individuals. At the same
