TABLE OF CONTENTS

	TITLE	No
PART 1:QoS APPROACHES		
CHAPTER 1:	Introduction to QoS Approaches	2
CHAPTER 2:	Internet Quality Of Service Architectures	11
CHAPTER 3:	Integrated Services	17
CHAPTER 4:	Differentiated Services	21
CHAPTER 5:	Quality Of Service (QoS) Ad-Hoc On-Demand Distance Vector (AODV)	27
CHAPTER 6:	QoS Routing In Ad-Hoc Wireless Networks	33
CHAPTER 7:	MPLS And Traffic Engineering	41
PART 2: MOBILITY MANAGEMENT APPROACHES		
CHAPTER 8:	Introduction to Mobility Management	47
CHAPTER 9:	Nested Mobile Networks	53
CHAPTER 10:	Evaluation of NEMO Extensions	59
CHAPTER 11:	Handoff Process In Micromobility Protocols	65
CHAPTER 12:	Comparison Between Network Simulators	71
PART 3: WIRELESS TECHNOLOGY		
CHAPTER 13:	Introduction to Local Area Network (LAN) Communication Protocols	77
CHAPTER 14:	MANET routing protocols	85
CHAPTER 15:	VANET Applications	95
CHAPTER 16:	Vehicle To Vehicle Routing Protocols	101
CHAPTER 17:	Wi-Fi Mesh Network	111
CHAPTER 18:	Overview Of Wimax Mesh	117
CHAPTER 19:	Current Trends On WIMAX Using MIMO Technology	129
CHAPTER 20:	Self-Organized Femtocell Networks	141
CHAPTER 21:	Self-Organized Synchronization For Femtocell Network	155
CHAPTER 22:	Spectrum Management In Femtocell	169
CHAPTER 23:	Smart Grid Communication	179
CHAPTER 24:	UWB Overview	189
CHAPTER 25:	ZIGBEE Applications	197

CHAPTER 26:	Improvement Of Vertical Handover In GPRS/WIFI Seamless Convergence	205
CHAPTER 27:	The Application Of Sensor Network And Routing Protocols In Wireless Communication	215
CHAPTER 28:	A Study Of Channel Assignment Approach To Reduce Frequent Reassignment	227
CHAPTER 29:	Association Management Schemes For Wireless Mesh Network	231
CHAPTER 30:	Challenges In Multi-Radio Multi-Channel Wireless Mesh Network	237
CHAPTER 31:	Mobility Support in Diffserv and MPLS network	243
CHAPTER 32:	Mobility Management And Context Transfer	247
CHAPTER 33:	LTE -Advanced Overview	251
CHAPTER 34:	Time Synchronization Protocols And Approaches	261
CHAPTER 35:	MPLS Architectures	265

CHAPTER 6

QOS ROUTING IN AD-HOC WIRELESS NETWORKS

6.1 INTRODUCTION

QoS routing is certainly essential in providing routing algorithms with the capability of identifying paths which satisfy the maximum possible number of flows with end-to-end limitations or restrictions. The key objectives of QoS routing can be summarized as follows:

1. Active establishment of feasible paths from among possibly many choices that will accommodate the requirements of the given flow.
2. Optimization of resource handling. Network resource can be utilized efficiently as well as total throughput can be improved.
3. Compensation for brief shortcomings in network which can lead to graceful performance degradation [1].

Due to the bandwidth constraints and dynamic network topology of MANETs, none of researches done on QoS support in the Internet can be directly used. Information such as delay, bandwidth, cost, loss rate, and error rate in the network should be available and manageable to provide QoS support. Unfortunately, it is very difficult to get and manage the information in MANETs since the quality of a wireless link could vary with the surrounding circumstances. Moreover, the resource limitations and the mobility of hosts require implementation of complex QoS functionality with limited available resources in a dynamic environment [2].

QoS support in MANETs consists of QoS models, QoS resource reservation signalling, QoS routing, and QoS Medium Access Control (MAC). The relationships among all these QoS components are as follows. First of all, a QoS model specifies an architecture in which some kinds of services could be provided in MANETs. It acts like the system goal that should be implemented. Meanwhile, all other QoS components such as QoS signalling, QoS routing, and QoS MAC must work together to achieve this goal. Second, QoS signalling acts as the control centre in QoS support. It coordinates the behaviours of QoS routing, QoS MAC, and other components such as admission control and scheduling. QoS model determines the functionality of QoS signalling. Third, QoS routing looks for a path with enough resources. However, the resources reservation along the path is handled by QoS signalling. The reservation is decided by QoS routing or other
