# TABLE OF CONTENTS

	TITLE	No
<b>PART 1:QoS APPROACHES</b>		
<b>CHAPTER 1:</b>	Introduction to QoS Approaches	2
<b>CHAPTER 2:</b>	Internet Quality Of Service Architectures	11
<b>CHAPTER 3:</b>	Integrated Services	17
<b>CHAPTER 4:</b>	Differentiated Services	21
<b>CHAPTER 5:</b>	Quality Of Service (QoS) Ad-Hoc On-Demand Distance Vector (AODV)	27
<b>CHAPTER 6:</b>	QoS Routing In Ad-Hoc Wireless Networks	33
<b>CHAPTER 7:</b>	MPLS And Traffic Engineering	41
<b>PART 2: MOBILITY MANAGEMENT APPROACHES</b>		
<b>CHAPTER 8:</b>	Introduction to Mobility Management	47
<b>CHAPTER 9:</b>	Nested Mobile Networks	53
<b>CHAPTER 10:</b>	Evaluation of NEMO Extensions	59
<b>CHAPTER 11:</b>	Handoff Process In Micromobility Protocols	65
<b>CHAPTER 12:</b>	Comparison Between Network Simulators	71
<b>PART 3: WIRELESS TECHNOLOGY</b>		
<b>CHAPTER 13:</b>	Introduction to Local Area Network (LAN) Communication Protocols	77
<b>CHAPTER 14:</b>	MANET routing protocols	85
<b>CHAPTER 15:</b>	VANET Applications	95
<b>CHAPTER 16:</b>	Vehicle To Vehicle Routing Protocols	101
<b>CHAPTER 17:</b>	Wi-Fi Mesh Network	111
<b>CHAPTER 18:</b>	Overview Of Wimax Mesh	117
<b>CHAPTER 19:</b>	Current Trends On WIMAX Using MIMO Technology	129
<b>CHAPTER 20:</b>	Self-Organized Femtocell Networks	141
<b>CHAPTER 21:</b>	Self-Organized Synchronization For Femtocell Network	155
<b>CHAPTER 22:</b>	Spectrum Management In Femtocell	169
<b>CHAPTER 23:</b>	Smart Grid Communication	179
<b>CHAPTER 24:</b>	UWB Overview	189
<b>CHAPTER 25:</b>	ZIGBEE Applications	197

<b>CHAPTER 26:</b>	Improvement Of Vertical Handover In GPRS/WIFI Seamless Convergence	205
<b>CHAPTER 27:</b>	The Application Of Sensor Network And Routing Protocols In Wireless Communication	215
<b>CHAPTER 28:</b>	A Study Of Channel Assignment Approach To Reduce Frequent Reassignment	227
<b>CHAPTER 29:</b>	Association Management Schemes For Wireless Mesh Network	231
<b>CHAPTER 30:</b>	Challenges In Multi-Radio Multi-Channel Wireless Mesh Network	237
<b>CHAPTER 31:</b>	Mobility Support in Diffserv and MPLS network	243
<b>CHAPTER 32:</b>	Mobility Management And Context Transfer	247
<b>CHAPTER 33:</b>	LTE -Advanced Overview	251
<b>CHAPTER 34:</b>	Time Synchronization Protocols And Approaches	261
<b>CHAPTER 35:</b>	MPLS Architectures	265

## CHAPTER 26

### IMPROVEMENT OF VERTICAL HANDOVER IN GPRS/WIFI SEAMLESS CONVERGENCE

MOHAMMED ABDULJAWAD, HATEM F.H., A.W. NAJI AND RASHID A. SAEED.

#### 26.1 INTRODUCTION

Interworking mechanisms are of prime importance to achieve ubiquitous access and seamless mobility in heterogeneous wireless networks and it also known as Handover. Many handover algorithms have been implemented between heterogeneous networks. GPRS/WLAN is one of the most attractive example of the heterogeneous handover and also can be called as the Vertical Handover (VHO). GPRS operates in various frequency bands depending on the country and the operator itself. General Packet Radio Service (GPRS) can be defined as a packet data technology that enables GSM operators to launch wireless data services, such as e-mail and Internet access. GPRS provides operators with the ability to use data to gain additional income. GPRS is well known as the 2.5 generation (2.5G) technology as it is a GSM operator's first step toward the third generation (3G) and a first step in wireless data services [1]. By distributing a high-speed Internet access from cable, Digital Subscriber Line (DSL), and other fixed broadband connections within the wireless hotspots, WiFi has dramatically increased productivity and convenience. Today, there are nearly pervasive WiFi that delivers the high-speed Wireless Local Area Network (WLAN) connectivity to millions of offices, homes, and public locations, such as hotels, cafés, and airports. The integration of WiFi into notebooks, handhelds and Consumer Electronics (CE) devices has accelerated the adoption of WiFi to the point where it is nearly a default feature in these devices [2]. Among the differences between the WiFi and the GPRS networks are the Media Access Control (MAC) and the spectrum determines the mechanisms of channel assignment. The allocated spectrum for the WiFi system is completely operated in the license-exempt (unlicensed) band, while most GPRS systems use the licensed band. As a result, GPRS and WiFi have different MAC designs [3].

This paper proposes an improved GPRS/WiFi VHO. GPRS and WiFi, as well as illustrates how service providers can leverage these technologies to offer wireless broadband Internet connectivity and compelling new services at affordable prices and in more locations. The paper is using a GWGW (GPRS/WiFi Gateway) adaptation layer to reduce the delay in the protocol conversion. The realization of the inter-working between these two standards is discussed and evaluated. The results are compared with the other
