TABLE OF CONTENTS

| | TITLE | No |
|---|--|-----|
| PART 1:QoS APPROACHES | | |
| CHAPTER 1: | Introduction to QoS Approaches | 2 |
| CHAPTER 2: | Internet Quality Of Service Architectures | 11 |
| CHAPTER 3: | Integrated Services | 17 |
| CHAPTER 4: | Differentiated Services | 21 |
| CHAPTER 5: | Quality Of Service (QoS) Ad-Hoc On-Demand Distance Vector (AODV) | 27 |
| CHAPTER 6: | QoS Routing In Ad-Hoc Wireless Networks | 33 |
| CHAPTER 7: | MPLS And Traffic Engineering | 41 |
| PART 2: MOBILITY MANAGEMENT APPROACHES | | |
| CHAPTER 8: | Introduction to Mobility Management | 47 |
| CHAPTER 9: | Nested Mobile Networks | 53 |
| CHAPTER 10: | Evaluation of NEMO Extensions | 59 |
| CHAPTER 11: | Handoff Process In Micromobility Protocols | 65 |
| CHAPTER 12: | Comparison Between Network Simulators | 71 |
| PART 3: WIRELESS TECHNOLOGY | | |
| CHAPTER 13: | Introduction to Local Area Network (LAN) Communication Protocols | 77 |
| CHAPTER 14: | MANET routing protocols | 85 |
| CHAPTER 15: | VANET Applications | 95 |
| CHAPTER 16: | Vehicle To Vehicle Routing Protocols | 101 |
| CHAPTER 17: | Wi-Fi Mesh Network | 111 |
| CHAPTER 18: | Overview Of Wimax Mesh | 117 |
| CHAPTER 19: | Current Trends On WIMAX Using MIMO Technology | 129 |
| CHAPTER 20: | Self-Organized Femtocell Networks | 141 |
| CHAPTER 21: | Self-Organized Synchronization For Femtocell Network | 155 |
| CHAPTER 22: | Spectrum Management In Femtocell | 169 |
| CHAPTER 23: | Smart Grid Communication | 179 |
| CHAPTER 24: | UWB Overview | 189 |
| CHAPTER 25: | ZIGBEE Applications | 197 |

| | | |
|--------------------|---|-----|
| CHAPTER 26: | Improvement Of Vertical Handover In GPRS/WIFI Seamless Convergence | 205 |
| CHAPTER 27: | The Application Of Sensor Network And Routing Protocols In Wireless Communication | 215 |
| CHAPTER 28: | A Study Of Channel Assignment Approach To Reduce Frequent Reassignment | 227 |
| CHAPTER 29: | Association Management Schemes For Wireless Mesh Network | 231 |
| CHAPTER 30: | Challenges In Multi-Radio Multi-Channel Wireless Mesh Network | 237 |
| CHAPTER 31: | Mobility Support in Diffserv and MPLS network | 243 |
| CHAPTER 32: | Mobility Management And Context Transfer | 247 |
| CHAPTER 33: | LTE -Advanced Overview | 251 |
| CHAPTER 34: | Time Synchronization Protocols And Approaches | 261 |
| CHAPTER 35: | MPLS Architectures | 265 |

CHAPTER 28

A STUDY OF CHANNEL ASSIGNMENT APPROACH TO REDUCE FREQUENT REASSIGNMENT

OMAR ZAKARIA, AISHA HASSAN ABDALLA HASHIM, RASHID ABDEL HALEEM

28.1 INTRODUCTION

Channel assignment in multi-radio multi-channel wireless mesh network is still a challenging problem. The main question is how to assign a feasible channel for each radio to maximize the network throughput. Many solutions have been proposed by researchers. These proposals can mainly be categorized into static and dynamic strategies, based on how frequently interfaces are switched from one channel to another. The trade-off between the efficient resource utilization and the amount of channel reassignments has to be considered by the channel assignment algorithms. Therefore, an efficient channel assignment scheme is needed to minimize the amount of reassignment overhead and as a result increase the total achieved throughput of the network.

28.2 THE PROPOSED CHANNEL ASSIGNMENT APPROACHES

Many studies have been done on channel assignment with consideration to reduce the reassignment frequency [1][2][3][4].

Arun et al. [2] propose a reconfiguration algorithm called Clustered Channel Assignment Scheme (CCAS), based on clustering of similar traffic matrices. It clusters a set of traffic matrices in a sequence that to reduce the frequent channel reassignment, thus each cluster has a common channel assignment. As long as the system remains in the same cluster, no channel reassignments take place. In this algorithm, CCAS is invoked at each time the traffic demand changes. But it will avoid the channel reassignment if the sequence of traffic matrices belongs to the same cluster. Each cluster in turn contains a set of traffic matrices and represented by a traffic matrix which is a weighted average of traffic matrices belonging to the cluster. The distance between two successive traffic matrices is calculated by using the Euclidian distance between the corresponding Inversion Vectors [5] (which represent the ordering of the edges) of these two traffic matrices. However, Using this way alone is not enough to give an accurate indication of the need of channel reassignment, because it is not reflected the number of flows that's affected by this traffic load changed due to the current
