TABLE OF CONTENTS

	TITLE	No
PART 1:QoS APPROACHES		
CHAPTER 1:	Introduction to QoS Approaches	2
CHAPTER 2:	Internet Quality Of Service Architectures	11
CHAPTER 3:	Integrated Services	17
CHAPTER 4:	Differentiated Services	21
CHAPTER 5:	Quality Of Service (QoS) Ad-Hoc On-Demand Distance Vector (AODV)	27
CHAPTER 6:	QoS Routing In Ad-Hoc Wireless Networks	33
CHAPTER 7:	MPLS And Traffic Engineering	41
PART 2: MOBILITY MANAGEMENT APPROACHES		
CHAPTER 8:	Introduction to Mobility Management	47
CHAPTER 9:	Nested Mobile Networks	53
CHAPTER 10:	Evaluation of NEMO Extensions	59
CHAPTER 11:	Handoff Process In Micromobility Protocols	65
CHAPTER 12:	Comparison Between Network Simulators	71
PART 3: WIRELESS TECHNOLOGY		
CHAPTER 13:	Introduction to Local Area Network (LAN) Communication Protocols	77
CHAPTER 14:	MANET routing protocols	85
CHAPTER 15:	VANET Applications	95
CHAPTER 16:	Vehicle To Vehicle Routing Protocols	101
CHAPTER 17:	Wi-Fi Mesh Network	111
CHAPTER 18:	Overview Of Wimax Mesh	117
CHAPTER 19:	Current Trends On WIMAX Using MIMO Technology	129
CHAPTER 20:	Self-Organized Femtocell Networks	141
CHAPTER 21:	Self-Organized Synchronization For Femtocell Network	155
CHAPTER 22:	Spectrum Management In Femtocell	169
CHAPTER 23:	Smart Grid Communication	179
CHAPTER 24:	UWB Overview	189
CHAPTER 25:	ZIGBEE Applications	197

CHAPTER 26:	Improvement Of Vertical Handover In GPRS/WIFI Seamless Convergence	205
CHAPTER 27:	The Application Of Sensor Network And Routing Protocols In Wireless Communication	215
CHAPTER 28:	A Study Of Channel Assignment Approach To Reduce Frequent Reassignment	227
CHAPTER 29:	Association Management Schemes For Wireless Mesh Network	231
CHAPTER 30:	Challenges In Multi-Radio Multi-Channel Wireless Mesh Network	237
CHAPTER 31:	Mobility Support in Diffserv and MPLS network	243
CHAPTER 32:	Mobility Management And Context Transfer	247
CHAPTER 33:	LTE -Advanced Overview	251
CHAPTER 34:	Time Synchronization Protocols And Approaches	261
CHAPTER 35:	MPLS Architectures	265

CHAPTER 33

LTE-ADVANCED OVERVIEW

33.1 INTRODUCTION

LTE-Advanced (LTE-A) is an extension of LTE which has been encapsulated in 3GPP (3rd Generation project partner) Release 10 in 2011. A significant requirement of LTE-A system is to achieve the highly spectral efficiency for both cell-edge and cell-center users. This can make the road for 4G easy for LTE-advance by adding some features to LTE Release 8 such as multicarrier aggregation, advanced MIMO schemes and CoMP system.

Carrier aggregation represents the significant key part of the LTE-advanced. It enables bandwidth extension to support deployment bandwidth up to 100MHz to provide a larger system Bandwidth. Therefore, it has advantage of limiting the cost of equipment and enabling much of the technology developed for LTE Release 8 to be reused. Each component carrier within an aggregation is designed to be basically similar to LTE release 8 carriers so they can be configured in a backward-compatible way and used by legacy UEs if desired. Up to five component carrier with a Bandwidth of up to 20 MHz each can be aggregating in LTE-A to make efficient use of the available spectrum and achieve the desired total Bandwidth and peak data rates. It will also allow LTE_A target peak data rates in excess of 1 Gbps in the downlink and 500 Mbps in the uplink to be achieved.

Multi-antenna or MIMO (multiple inputs, multiple outputs) is one of the feature technologies which enhanced LTE to become LTE-A Release 10. It is based on transmitting and receiving with multiple antennas and utilizing uncorrelated communication channels when radio signals propagate through the physical environment. LTE Release 8 and 9 support multi antenna (MIMO) technology with up to four transmitter and receiver antennas in downlink, but only single antenna transmission in uplink. Release 10 extends the MIMO support for eight transmitter and receiver antennas in downlink and introduces uplink MIMO by supporting up to four transmit and eight receiver antennas. There are two types of MIMO (Single-User and Multi-User). We distinguish between them, although a common set of concepts captured the essential MIMO benefits in both cases. Single- User MIMO techniques dominated the algorithms selected for the first version of LTE, while Multi-User MIMO becomes more established in Release 10. Downlink (Multi-User MIMO) implies downlink transmitting to different terminal using the same time-frequency resource and relying on the
