4.1 INTRODUCTION

Multicast Hierarchical Mobile IPv6 is a multicast mobility scheme based on HMIPv6 protocol to support multicast in mobility IPv6 environment. It enhanced the message and data format of the multicast services handover

The Hierarchical Mobile IPv6 (HMIPv6) concept is simply an extension to the Mobile IPv6 (MIPv6) [1] protocol which is fundamental approach to deal with mobility in IPv6. Multicast HMIPv6 (M-HMIPv6) [2] is a multicast mobility scheme based on HMIPv6 [3] protocol. HMIPv6 introduces Mobility Anchor Points (MAP) as proxy elements to the existing MIPv6. The MAP is introduced in order to reduce communication delays with respect to the Home Agent (HA).

The delays are because Mobile IPv6 (MIPv6) involves roundtrip messages for location updates directly with the MNs Home Agent and the Correspondent Node (CN). As these nodes can be far away, MIPv6 suffers from slow handovers and inefficient forwarding. According to Thomas C. Schmidt and Matthias Wachlisch [4], M-HMIPv6 intended to improve HMIPv6 mobility infrastructure by mechanisms of sending and receiving multicast traffic for the Mobile Node (MN). Fig. 1 shows intra domain handover in HMIPv6 [7]. Fig. 2 shows inter domain handover in HMIPv6.
