ABSTRACT

Glucoamylase is a starch-converting enzyme which is widely used in textile and food industry and also in bio-ethanol production. Therefore, the production of inexpensive glucoamylase by using low cost agricultural residue was studied. Several potential fungal strains from local isolates – *Aspergillus niger* 0-102A, 0-109A, A-101, and Basidiomycete R01, R02 and R03 – were screened for glucoamylase production with rice bran as the substrate media. Maximum glucoamylase activity (362.56 U/g dry substrate-gds) was obtained from *A. niger* 0-109A in 96 h with an inoculum, moisture content and pH of 5% (v/w), 60% and 5, respectively at 32°C. The concentration of glucose, yeast extract, and minerals such as potassium, magnesium, sodium and ammonium was studied to determine the optimum media composition. From single factor experiments, the glucose and potassium concentration that contribute to optimum glucoamylase activity were 4% w/w (330.03 U/gds) and 0.06% v/w (453.70 U/gds) respectively.

Keywords: glucoamylase, rice bran, fungal strains, enzyme, agricultural residue

INTRODUCTION

Starch processing industry is a major industry which uses the starch-converting enzymes in the production of maltodextrin, glucose and fructose syrups. As the industry matures and shifts from traditional acid hydrolysis of starch to the use of enzyme, the demand for the starch-converting enzymes also increases. A number of these starch converting-enzymes belong to the α -amylase family and one of them is glucoamylase (Van der Maarel et al, 2002). In meeting the high command for glucoamylase, large scale production of this enzyme with the cheap or sustainable operational cost will be very attractive to the industry.

The current sources of starch and hence amylases for the major industry are maize, tapioca, potato and wheat. In the European Union, 3.6 million tons of maize starch, 2 million tons of wheat starch and 1.8 million tons of potato starch were produced in 1998 (Van der Maarel et al, 2002) and some of the quantity is bought by the starch process industries. Tea waste and copra waste have been reported as substrates for amylase production from
