1: Why the search?

INTRODUCTION
• Teaching on the subject of Malay Architecture to students of the 21st Century is a challenge.

• While the subject is address widely based on theories implicitly bound to a western framework of knowledge generally written by alien cultures, little known effort were made to reintroduce them based on the true origin of knowledge as revealed by the Al Quran and Sunnah nor written explicitly by scholars understanding the true nature of the Malays.
INTRODUCTION- the issue

- Our youths, depleted of their built heritage and lived within the alien built environment of international flavour, can only listen to our 'story', as a lamentation of the past.
- Without passion on the subject there will be no lead.
- No one will enquire What is Malay Architecture? What and why has shaped, formed and decorated the built form of the Malay habitat? What are their significance to present architecture? What technology have they applied in their craft to come this far? Were there special rituals in the construction and choosing of building site? There are so many types of Malay houses of many shapes and styles, is there any correlation among the regional habitat to identify as the Malay Architecture?

- Existing theories, hypothesis and perceptions rules in the game of knowledge till the truth are found
INTRODUCTION

• Towards the building up of facts for the near truth basis of the Malay architectural heritage, this paper discussed selected theories and review tangible aspects of the built forms or styles and typologies of architectural forms from examples acquired from Thailand, Indonesia, Malaysia, Cambodia, Laos PDR Vietnam and the Philippines, believed to be part of the greater Malay descendants, where available.
2: The Approach

METHODOLOGY
The search of architectural origins falls within several assumptions/parameters based on Al Quran and Sunnah.

- The first Man, Prophet Adam A.S, was created as a civilised being
- Humans have always lived civilized lives in all periods of history

The discussion is then developed upon the hypothesis that the ethnic Malays, as a civilised race, thousands of years ago, due to reasons unknown to us, had migrated from mainland Asia towards the archipelago.
Primary typologies of the Malay Architecture were selected as basis of comparison for similarities and differences on its built form i.e. *Masjid and House*

Case studies were conducted by primary and secondary means found within the region that includes Malaysia, Indonesia, Cambodia, Thailand, Laos PDR, Vietnam and the Philippines, where possible

Analyse and report preliminary findings on each typology.
3: The Research

THE RESEARCH
3.1: Background

The Malays
The Malay Architectural Heritage
Who Are The Malays?

Malay Heritage Conference in Cambodia, Lao PDR & Vietnam 24-26 June 2010
Who are the Malays?

- **Definition**
  "any member of an ethnic group of the Malay Peninsula and portions of adjacent islands of Southeast Asia, including the east coast of Sumatra, the coast of Borneo, and smaller islands that lie between these areas" (Sejarah Melayu (2010) and Britannica Encyclopedia online (2010))

- The Malay culture has been strongly influenced by that of other peoples, including the Siamese, Javanese, and Sumatran. The influence of Hindu India was historically very great, and the Malays were largely Hindus before they were converted to Islām in the 15th century".

- Sejarah Melayu (2010) quoted that for almost 2000 years the non-stop trading traffic between India and the archipelago as well as with China, Champa and Cambodia had provided a rich background influences emerging through trade, culture and inter-marriages.
What is Malay Architecture?

- Historians suggested that the movement of people from the mainland Asia towards the peninsular and islands in the southern region of East Asia is one of the important governing factors in deciding the architectural style of this region.

- The similarities are now seen on the surviving architectural heritage in the form of *masjids, palaces, houses* and etc. However, most discussion on the Malay architecture dwells mainly on *the traditional houses*. 
The story told on reliefs and carvings showed similar architecture of houses raised on stilts, which some historians called it “raise on pile”, to belong to the place of origin of those that came either to Java or stayed in the Angkor kingdom.

The architectural and other heritage of the Malays are reflected in this close knit society of many talents, rulers, warriors and seafarers through feudal social organisation with a sharp division between nobility and commoners.

4: Preliminary Findings

Masjids
Findings on Masjid

- Islam came to the region through maritime travels via:
  - India-Sumatra-Malacca or
  - Champa-Pattani-Kelantan
  - Or both ways
- Early masjids were of the Malay Archipelago vernacular architecture of the locality and building structures of timber columns and beams, bamboo wall and layout that can be adapted to accommodate a big congregation under one roof.
- The existing architectural elements handed down from generation to generation of craftsman were utilised to the best possible to complement the new faith from the old.
The Findings

• **Masjid**

• Design of the masjids were based on the philosophy of the old Hindu *mandala* or square plans requiring 4 pillars or *tiang seri* to hold the 3-tiered colossal roof.

*Mandala of Om*
www.exoticindiaart.com
The Findings

- **Masjid**
- The odd-numbered tiered pyramidal roof was associated with the *meru* or symbolic mountain resembling the movement upwards towards heaven or nirvana
- Old masjids in Indonesia were adapted from *chandis*
- The masjids underwent adaptations from Hindu beliefs to Islam: the tiered roofs for e.g. commemorates *Islam, Iman* and *Ihsan* instead and one of the sides of the *mandala* faces the *qiblat*
The Findings

- **Masjid**
  - The planning of the masjids in settlement layouts of Demak, Yogjakarta, Kota Bharu and Kuala Terengganu have similarities:
    - All have sultans
    - The sultans’ palaces faced the coast or river at one end
    - The masjids were located either on the left or right of the town square or *alun-alun*
    - The masjids come with cemeteries and houses for *imams* and *madrasas*
The Findings

• **Masjid**

• Other influences:
  • From as far as Laos, Vietnam, through Cambodia and Thailand, many masjids are deeply entrenched with hybrid architecture of Indian and Persian heritage
  • The main characteristics include the domes and arches
The Findings

- **Masjid**

- Towards sustainability:
  - Climatic masjid design initiated by Jimmy Lim, rebuilding of the standard pyramidal masjid in Pahang.
  - Square plan and three tiered roof based on Masjid Tengkera as the chosen design for Masjid Al Azim

Fig 18: Jimmy Lim’s version of tropical masjid

Fig 21: Masjid Al-Azim. Melaka’s state masjid (1980s)
The Findings

• **Masjid**

• Towards sustainability:
  • IIUM’s contemporary pyramidal roof masjid extension to the Indian type masjid in Belukar Luas, Ketereh, Kelantan.

Fig 22: Masjid Al-Falah - Proposed Contemporary Traditional Masjid for Belukar Luas, Ketereh, Kota Bharu, Kelantan (2009)
According to Ghafar Ahmad (1999):

- the design of the vernacular masjid reflects most of the characteristics of the traditional Malay houses.
- The architectural style of the vernacular masjids are influenced by four major factors including:
  - climatic conditions,
  - availability of building materials,
  - craftsmanship and
  - ethnic background.

Malay Heritage Conference in Cambodia, Lao PDR & Vietnam 24-26 June 2010
Building materials such as timber, bamboo, bricks, stone, clay tiles and attap are widely used in the vernacular mosques as they are easily available locally.

Like the Malay houses, the vernacular masjid portray high level of craftsmanship which are demonstrated in the windows, fanlights, carving wall panels, fascia boards and well-designed mimbar with intricate flower motifs. Such craftsmanship generally reflects the owners' status and wealth, particularly for the Malay houses.
Conclusion on Masjid

- Malay architecture is indeed a **flexible architecture**: It is able to adopt invariably a new typology as part of the community asset in a gradual manner and enhance it with magnificent roof structures that encompassed function for the believers and aesthetic expression of the craftsmen eager to service the best towards oneness of God in a balance manner.
Case Study : Houses

HOUSE TYPOLOGY

Malay Heritage Conference in Cambodia, Lao PDR & Vietnam 24-26 June 2010
The Traditional Houses

- Traditional houses definitely have relationship to each other and the development of the styles is closely related to the movement of people.
- Unlike the masjid, houses are closer to man and society.
- The Malays themselves lives in clusters and the concept of kampong living or country living, leaves every household quite free with their respective house design that is literally modularised by the sizes of the building material, rank in society and the family’s affordability.
- Malay houses are naturally conceived through years of trial and error of the village craftsmen and the community.
The Traditional Houses

- Malay traditional houses are built in stages that represent the basic and additional needs of the family.
- Section by section may be added in congruent to the growth of the family or acquired wealth.
- Status in society dictates the style and ornamentation including type of timber used.
- Like the masjid, the roof of the house identifies the origin and status of the occupant.
The Malay houses, depending on its respective belief system and long alienation from place of origin had reinvented their home to respect their adopted faith and new culture.

The house as abode for the family with the mother as a central figure, the dimension uses to plan and design the spaces are from the mother of the house.

Pre-Islamic rituals were conducted to appease the spirits lead by the mother of the house.

The hearth or kitchen as the central core dictate the main activities of the occupants.

Fig. 32 Traditional House, Sulawesi
4: Preliminary Findings

Traditional Houses
The houses on stilts are found along the span of more than six thousand kilometres, which is from Melanesia to Indonesia to Japan while on the Asian continent, as far as Nepal to Southeast Asian and South China (Jumsai).

In this region, the housing on stilts are manifested in various forms that reflects the beliefs, social and culture of specific regions.

While the houses in Malaysia are influenced by Islam as a way of life, the Batak house in Sumatera and Torajah house in Sulawesi Indonesia are influenced by the local belief and culture of the people.
The Malay traditional houses in Malaysia are commonly oriented towards kiblat (Makkah) and are void of decorations accept for some floral motifs in form of carvings.

The Indonesian version of Batak and Torajah houses have forms and decorations that symbolize their belief system, i.e. lizards and three distinct colours of white (realm of deities), red (the human world) and black (the spirits of the underworld). These tripartite segments of houses are prevailing in many parts of Indonesia including the Torajah and Batak houses.
Findings on Houses

Realm of the Dead

Realm of the Living

Realm of the Evil Spirit

Figure 33: The Tripartite Symbolism in Houses on Stilts in Indonesia

BELIEFS
The raised housing on stilts also has been agreed by many to be a gesture of response to the climate. Hence hypothesized as an environmental reflection.

The differences have been hypothesized that the houses are reflection of the belief system, culture and behaviour.

The differences may also occur due to the geographical conditions. The houses on stilts near the body of water, i.e. river and lakes may manifest by having tall stilts as seen on the banks of Tonle Sap, Cambodia or on the shores of Brunei and other settlements fronting the seas.
Findings on Houses

In Cambodia, the houses are tall and mainly accommodate a set of activities and spaces underneath the houses.
Findings on Houses

Besides utilizing the underneath of houses as activity spaces, the area sometimes are storage spaces for daily utensils and also livestocks. Usually the areas used for storage are lower and can be seen in Malaysia and Indonesia. These examples show that the utilization of the houses on stilts are similar even though the places are distant from one another.

Batak Toba

Malay peninsula house
Malay vernacular traditional houses, although varies in its geographical and physical make up, have the similarity of its usage from common defined spaces such anjung, rumah ibu, serambi and dapur.

The craftsmanship, including building details and construction techniques were able to adapt to contemporary lifestyle with modifications.
Predominantly houses made of sustainable material found in the locality i.e. timber, grass and bamboo; depending on status, the quality of timber will vary.

Due to effect of weather and location, will raise their floor to full height or half the height to prevent flood, secure from wild animals, allow coolness as well as spaces below to rest, work, as storage and as animal pen.

Pitch roof form of various degree, height, gradient and make that will prevent water seepage but will cool or warmth the interior; provide for storages and decorate with meaningful characters based on belief systems.
Building parts and components that can be constructed by module based on need.

Have lofts or *loteng* at kitchen area

Created from multifunctional single space dwellings to designate spaces based on function, wealth and status in the society

Have a water vase or *buyung* at the front steps for washing the feet.

Adaptable, flexible, transportable and reconstructable
5. Humble

CONCLUSIONS
Conclusion

The physical origin of the Malay architecture as we had now had indeed evolved through many factors of time, place, availability of resources and the effect of physical and socio-cultural environment each community interface in their path and lifetime.
The Malays were known as seafarers and travellers apart from keen craftsmen and agriculture bound.

As a common culture, the Malays, despite being in different locality and belief systems, have similarity in the craftsmanship and skills whether it is boat building, building construction techniques or weaving.

New ways are learned and integrated as the Malays mixed with other cultures and places through trades, travels, pilgrimage and even on study mission or as missionaries.
The Malay architecture we are thriving on at present times are in the form of contemporary concrete or brick masjids and suraus, bungalows, town houses and terrace houses in comparison to just made from timber.

The built forms are but continuation of the past and into the present following new lifestyle borrowed or assimilated due to the need to change as resources are scarce.
Conclusion

- As the Malays migrated to towns and cities, regulatory requirements inserted through Uniform Building by-laws, the Fire Act and insurances on housing had profound effect on the choice of architecture of the town folks in their purchasing of home or building of structures. While the Malays in the countryside enjoy their choice of abode and masjid, the town folks had to live within the limitation of the law imposed.
While it is rather sad that rural folks are mesmerised by town folk’s “progress” in their idea and perception of perfect abode and long term nature of their structures, Disney and American catalogue likes houses mushrooming amidst padi fields and fishermen’s village in coastal areas; tranquil and quaint timber masjids were also replaced with replica of middle-eastern cum western brick and mortar architecture.
...and yet in towns and cities

- urbanfolks are yearning for their roots...

Fig 37. Sample of ‘reminiscing the tradition’ houses in tight urban setting of Kg Tunku, Petaling Jaya (2010).
In seeking the origin on just two building typologies, the *masjid* and the *house*, the study had disclosed the rigmarole of assumptions based on historical evidence of adjacent structures as well as those built within the same period yet to be rediscovered.
Conclusion

- While we continue our search for the Malay origin in the teaching of architectural history on the Malay architecture to new generation, perhaps it is not too late as a recommendation, to include the essence of the requirements that addresses the climatic and social concern towards sustainability extracted from both vernacular *masjids and houses*; into the neighbourhood planning and design guidelines of our towns and cities.
The knowledge and its application may assure the future that the long lost local technology based on intuition, experiences and hand down wisdoms are here to stay in its contemporary form relieving the progress and adaptation the vernacular architecture of the Malays always brings. *Wallahualam*
THANK YOU
TERIMA KASIH
&
AUGHUN
Focus on Muslim Architecture at both local and international context

Have documented

1. Local- Georgetown, Alor Setar and Kuala Kangsar

2. International-Egypt (Cairo), Turkey (Istambul), China (Xi’an and Hohhot), India (Fatehpursikri), Syria (Bimaristan) and Indonesia (Padang, Jogjakarta and Surabaya)
Georgetown, Pulau Pinang- Masjid Melayu, Syed al-Attas House and a few houses in the surrounding areas

Alor Setar, Kedah- Istana Cegar, Istana Pelamin, Istana Kuning, Istana Sepachendra, Masjid Zahir, Rumah Tok Menteri I and II

Kuala Kangsar, Perak-Baitul Rahmah, Bytul Anwar, Istana Gahara and Rumah Meor
