ABSTRACT
High requirement of job market inclined universities of today to make internship training as part of the graduation prerequisite. This study attempts to investigate the outcome of internship programme in Sociology and Anthropology department. Findings from this study explicitly show that internship amongst talents from this discipline has essentially improved their soft skills, increased their workplace literacy and wellbeing. Despite the lack of information about this discipline as well as its practicality aspects by the industry, sociology and anthropology students are well accepted in both private and public sector to undertake their internship training. Methodologically, this study was conducted to congregate the opinions and experience about internship programme amongst Sociology and Anthropology students. Survey was used to collect required data from 100 Sociology and Anthropology students who had completed their three months internship either in public or private sector. In general, internship is crucial particularly among social sciences students as it enriches their experiences, knowledge and skills both in personal and social life.

Keywords: Internship, sociology, soft skills, employment
