Colesus spp. are widely used in the region of tropical countries such as Vietnam, India and Indonesia as remedies for abdominal colic, respiratory disorders, painful menstruation and fever. In Malaysia, Colesus spp. are locally known as ‘Ati-ati’ plant and used primarily as ornamental. The use of Colesus spp. as remedies in Malaysia was previously unknown. The study was aimed to determine the total antioxidant content in three different Colesus spp., namely, Colesus amboinicus Lour. (CAL), Colesus blumei (purple hybrid) (CBP) and Colesus blumei (mix colour hybrid) (CBMC). The quantities of total antioxidants in different parts (stems, petioles and leaves) of the plants were also evaluated. Fresh CAL samples were randomly collected from Jakarta, Indonesia and samples of CBP and CBMC were randomly collected from Kuantan, Malaysia. Samples were freeze-dried, ground and extracted using methanol. The antioxidants content of the extracted samples were measured on the basis of scavenging activity of the stable 1,1-diphenyl-2-picrylhydrazyl (DPPH) free radical (DPPH radical-scavenging assay). Ascorbic acid and butylated hydroxy anisole (BHA) were used as positive control. Absorbance at 517 nm was determined after 30 min. and the percent inhibition activity was then calculated. Results showed that the total antioxidants content in CBP and CBMC were significantly higher (P<0.05) than in CAL but there was no significant difference (P>0.05) of total antioxidants content in CBP and CBMC. Different parts of CAL have the same (P>0.05) amounts of total antioxidants content. In CBP and CBMC, the leaves have the highest (P<0.05) content of the total antioxidants followed by petioles and stems. Colesus blumei showed greater amount of total antioxidants content compared to Colesus amboinicus Lour. The study showed the potential of Colesus spp. from Malaysia to be developed as natural functional food.
