## CONTENTS

**PREFACE**

iii

**CHAPTER 1**

Pretreatment of Lignocellulosic Oil Palm Empty Fruit Bunch Wastes as Valuable Carbon Source for Production of Useful Cellulases Enzymes  
Mohamed Ismail Abdul Karim, Faridah Yusof, Mansyia Zawri Abd. Wahid And Md. Zanghir Alam

1

**CHAPTER 2**

Utilization of Cassava Peel as Animal Feed  
Parveen Jamal, Tijjani Iyabo Dasola Ruqayyah, Md Zanghir Alam And Mohamed Elwathig Saeed Mirghani

35

**CHAPTER 3**

Pervaporation Process: Separation of Bioethanol From Direct Fermentation of Cassava Starch  
Md. Zanghir Alam, Nassereldeen A. Kabbashi And Salma Hawari

52

**CHAPTER 4**

Production of Selected Hydrolytic Enzymes from Agro-Residues  
Hanzah Mohd. Salleh, Md. Zanghir Alam And Aliyu Salihu

71

**CHAPTER 5**

Kinetic Studies on Biodiesel Production from Crude Palm Oil  
Nassereldeen Ahmed Kabbashi, Md Zanghir Alam, And Ashraf M. A. Al-Fusatei

98

**CHAPTER 6**

Production of Process Water from Biologically Treated Palm Oil Mill Effluent (POME) Using Ultrafiltration Membrane  
Mohammed S. Jami, Suleyman A. Mayibi, Munirat A. Idris

118

**CHAPTER 7**

Speciation of Fast and Slow Biochemical Oxygen Demand  
Zaki Zainudin, Norazah Abdul Rahma2, Norizan Abdullah

154

**CHAPTER 8**

Water Sampling and Testing for Nonpoint Source Pollution Load Estimation in Malaysia  
Abdullah Al Mannun

CHAPTER 8

Water Sampling and Testing for Nonpoint Source Pollution Load Estimation in Malaysia

Abdullah Al Mamun

Bioenvironmental Engineering Research Unit (BERU) Faculty of Engineering, International Islamic University Malaysia, P.O.Box 10, 50728 Kuala Lumpur, Malaysia

Introduction

Water resources are degraded due to addition of pollutants from point and nonpoint sources. Point pollution sources are usually noticeable, confined and the pollutant loads into the rivers and other water bodies are comparatively easy to estimate. Therefore, state of the art technologies can be easily and efficiently applied to abate pollution from the point sources (PS). On the contrary, nonpoint pollution sources (NPS) are not confined and it is difficult to estimate and capture the pollutants to reduce water pollution problems. Nonpoint pollution, directly and clearly, is governed by storm runoff. For the same housekeeping practices, more runoff means more pollution load. Due to high rainfall (more then 2000 mm per year), tropical regions have higher susceptibility to nonpoint source pollution both for rural and urban areas. Runoff from the agricultural lands are the main contributor to nonpoint pollution in rural areas; whereas residential land covers contribute significant amount of nonpoint pollution in the urban areas, which is more complex in nature compared to the agricultural and less developed areas. However, the major contributors of NPS pollution in urban areas are residential, industrial, commercial, institutional, recreational sites, roads and highways, parking lots, sewage treatment plants (overflows), etc. It has been reported that, even from the urban areas with good house-keeping practices, most of the nonpoint pollutants are generated
