## Abstract

Extensive processing of sea cucumber causes body deformation of the marine organism, hence causing difficulties in species identification of processed sea cucumbers. Due to the copresence of cases of unlabelled or mislabelled sea cucumber products in Malaysian markets and worldwide, a study was conducted to determine the species identities of sea cucumbers from selected Malaysian markets using non-protein-coding 12S mitochondrial rRNA gene. Phylogenetic analyses based on the distance-based Neighbour Joining method, and the character-based methods i.e. the Maximum Parsimony method, Maximum Likelihood method, and the Bayesian Analysis method of 82 ingroup sequences representing processed sea cucumber specimens, 13 fresh and processed reference samples for species identification, and five fresh additional specimens from Teluk Nipah Beach, Pangkor Archipelago and Manukan Island, Sabah suggested the presence of three main clusters i.e. a gamat family cluster consisting of family Stichopodidae (Stichopus horrens, Stichopus ocellatus and Thelenota anax) and two clusters of tereun laut family comprising family Holothuridae (Metenimothuria leucopileta, Holothuria (Metriatyla) scabra, Holothuria (Metriatyla) lessonae, Holothuria (Halodeima) atra, and Holothuria (Halodeima) edulis) and family Caudinidae (Acudina molgadoidea). The outcomes of this study also revealed the availability of 40 new 12S mitochondrial rRNA gene sequences deposited in the GenBank that can be utilised by the enforcement agencies to monitor and overcome the issues of species substitution and product mislabelling of processed sea cucumber products in Malaysian markets. © Universiti Putra Malaysia Press

## Funding text #1

The sea cucumber specimens were morphologically identified by referring to information provided by local residents, experts (Assoc. Prof. Alexander M. Kerr (Marine Laboratory, University of Guam, USA) and the participants of National Science Foundation (NSF) Partnerships for used as reference samples of processed sea cucumbers. For unlabelled species information was gained from the salespersons.

## Funding text #2

Thank you to Mr. Muhammad Izat B. Reduan, Mrs. Siti Nabillah Bt Mohd Rusli, and Ms. Sarina Irma Siti Saidon (the laboratory assistants of Food Biotechnology program, Faculty of Science and Technology, Universiti Sains Islam Malaysia, Nilai, Negeri Sembilan) for their assistance in the laboratories; all peer reviewers; all Food Biotechnology program the Ministry of Higher Education of Malaysia for the financial assistance. This research was supported by the Research Acculturation Grant Scheme (RAGS) Phase 1/2014 from the Ministry of Education (MDC) – Ref: USM/RAGS/TST/16/S0414 as well as the Fundamental Research Grant Scheme (FRGS) Phase 1/2015 from the Department of Higher Education USM/FRGS/TST/12/51515. Visit Malaysian Sea Cucumber Database at <http://sites.google.com/site/malaysianseacucumber/> for further research details on Malaysian sea cucumber species.
