Abstract

▾ View references (4)

A gastric diverticulum is an outpouching from the gastric mucosa. It is extremely rare . It is normally asymptomatic, but some may present with non-specific abdominal pain. A combination of upper gastrointestinal endoscopy and radiological contrast study such as oral barium study and computed tomography are needed to make a definite diagnosis and to rule out other associated pathology. Although treatment with medical therapy has been reported to be effective, the use of open and laparoscopic resection also yields a good outcome in the management of complicated gastric diverticulum . We present a case of symptomatic gastric diverticulum which has been successfully treated with medical therapy. © 2019 Default.
