Abstract

Peripheral ameloblastoma is an extraosseous type, rare form of ameloblastoma that proliferates on the soft tissue of tooth bearing region. It is usually an exophytic odontogenic tumour that exhibits with either smooth or irregular surface and is mainly located in the mandibular region namely the gingival area. This lesion is mainly limited by the periosteum but a larger lesion can have features of bony marginal saucerization as well as displacement of teeth. We hereby report a case of recurring peripheral ameloblastoma on the mandibular left premolar region in a 37 year-old Malay gentleman seen at the Kulliyyah of Dentistry, International Islamic University Malaysia. © 2019 Journal of International Dental and Medical Research.
