(A) Research Summary and Findings

The increasing number of arteries and organs needed for cardiovascular disease patients with end-stage organ failure has urged the need for tissue engineering. Decellularization of tissues or organs for the preparations of scaffolds has potential to preserve its original structure and ECM components (Fu et al., 2014). Recently, sonication decellularization technique has been established and proven to be able to prepare biological decellularized tissue efficiently. However, it resulted in incomplete decellularization, required long treatment time and caused alteration in biomechanical properties. We have successfully decellularized arterial tissue by sonication method in sodium dodecyl sulfate (SDS) solution disrupt of cell membrane (Norzarini et al., 2015). At low concentration of SDS, the process led to decellularized tissues with no cell remnants. In this study, it is hypothesized that the decellularized tissues have complete removal cell nuclei while maintaining similar extracellular matrix (ECM) composition, biological activity, and biomechanical integrity of the ECM. We characterize the biomaterial properties of the decellularized arterial tissue including free level of toxicity, extracellular matrix (collagen composition) and free from alpha-Gal antigen holds great potential in preparation of bioscaffolds. The outcomes will contribute to suggest the decellularized scaffolds having great potential for regenerative tissue/organ in the future.

III) Commercialization Outputs

For pre-commercialization of the prototype, further pre-clinical and clinical studies are needed to verify the prototype system to be fit for bioscaffolds preparations. Thus, there is still a long way to go until this prototype is ready to be used in bioscaffolds production. Nevertheless, in the short run, the sonication wave technology that is adapted in this system could benefit the cleaning and sterilization practices in many hospitals and research institutes labs. Thus, the “Sonication Decellularization System” hold immense potential to be pre-commercialized into industrial application serving in advanced cleaning system which is not only time saving, but also a more hygienic and cost effective approach in sterilization. Currently, we have few existing collaborators which are Sonictron SDN. BHD, Mediprotech (M) SDN. BHD, The University of Tokyo and Korea Institute of Science and Technology. In addition, the prototype has been patented and filed at PT/5600/UIAM-AZLAN/15.
