PREFACE

This prospective, randomized, controlled study was carried out to compare the usage of balanced and non balanced hydroxyethyl starch during elective colorectal surgery in term of changes in acid-base balance and renal profile in the immediate and early postoperative period. Thirty informed, consented, adult patients with ASA I-II, undergoing open colorectal surgery with duration of more than three hours were recruited after excluding those with significant cardiac, liver or renal diseases, and those with allergy to the starches. These patients were randomly allocated into two study groups. The Balanced group received an intraoperative fluid regimen that consisted of Hartmann's solution and balanced 6% hydroxyethyl starch (Tetraspan®). The Non Balanced group were given Hartmann's solution and saline-based 6% hydroxyethyl starch (Venofundin®). Patients were kept hemodynamically stable and normovolemia throughout the operation by giving boluses of the study fluids as volume replacement therapy. Biochemical indices for acid base balance and renal profile were reviewed at two endpoints: immediately post operation (at 1-hour) and early post operation (at 6-hour). There were no difference at immediate and early post operation respectively, noted in term of base excess ($p = 0.733$, $p = 0.507$) , chloride ($p = 0.483$, $p = 0.401$), lactate ($p = 0.477$, $p = 0.993$), urea ($p = 0.244$, $p = 0.190$) and creatinine ($p = 0.578$, $p = 0.323$) between both groups.

ACKNOWLEDGEMENTS

Alhamdulillah, all praises to Allah for His blessings, and for giving me the strengths in completing this dissertation. Special utmost appreciation goes to my supervisor, Prof Dr Jaafar Md Zain, Consultant Anaesthesiologist and Lecturer, Department of Anaesthesia and Intensive Care, Universiti Kebangsaan Malaysia Medical Center (UKMMC) for his supervision and constant support. Without his persistent invaluable help, this dissertation would not have been successful.

I am indebted to Assoc. Prof Dr Datin Norsidah Abd Manap, Consultant Anaesthesiologist and Head of Department of Anaesthesiology and Intensive Care, UKMMC and Prof Dr Lee Choon Yee, Consultant Anaesthesiologist and Lecturer, Department of Anaesthesia and Intensive Care, UKMMC for the priceless guidance extended to me.

I am thanking Assoc.Prof. Dato' Dr Mohd Basri Mat Nor, Head of Research of Kulliyah of Medicine for giving me the opportunity and guidance in the field of research. Also, I would like to extend my heartfelt gratitude towards my dedicated lecturers and colleagues who involved directly throughout my dissertation. Your cooperation and precious times spent to assist me with this dissertation are very much appreciated.

Last but not least, my deepest appreciation goes to my beloved parents, husband and children, for their endless love, understandings, prayers and encouragements.

To those who indirectly contributed to this research, your kindness really means a lot to me.

Thank you very much.

NUR FARIZA RAMLY

TABLES

TABLE		Page number
I	Compositions of the study fluids.	5
II	Demographic patient characteristics and duration of operation. Values expressed as mean \pm standard deviation, number and percentage in parenthesis.	14
III	Perioperative fluid balance and hemodynamics. Values expressed as mean \pm standard deviation, number and percentage in parenthesis.	15
IV	Serum pH level at baseline, 1-hour and 6-hour postoperative. Values expressed as mean \pm standard deviation.	17
V	Base excess (mmol/L) at baseline, 1-hour and 6-hour postoperative. Values expressed as mean \pm standard deviation.	20
VI	Serum Chloride level (mmol/L) at baseline, 1-hour and 6-hour postoperative. Values expressed as mean \pm standard deviation.	23
VII	Serum Lactate level (mmol/L) at baseline, 1-hour and 6-hour postoperative. Values expressed as mean \pm standard deviation.	26
VIII	Serum Urea level (mmol/L) at baseline and 6-hour postoperative. Values expressed as mean \pm standard deviation.	29
IX	Serum Creatinine level (μ mol/L) at baseline and 6-hour postoperative. Values expressed as mean \pm standard deviation.	32
X	Number of patients with metabolic acidosis. Values expressed as number and percentage in parenthesis.	35
XI	Number of patients with hyperchloremia. Values expressed as number and percentage in parenthesis	37
XII	Number of patients with lactatemia. Values expressed as number and percentage in parenthesis.	39
XIII	Number of patient who developed metabolic acidosis with and without hyperchloremia.	40

	Values expressed as numbers and percentage in parenthesis.	
XIV	Number of patient who developed metabolic acidosis with and without hyperlactatemia. Values expressed as numbers and percentage in parenthesis.	41
