### Abstract

∨ View references (75)

A search for the pair production of heavy vectorlike partners T and B of the top and bottom quarks has been performed by the CMS experiment at the CERN LHC using proton-proton collisions at  $\sqrt{s} = 13$  TeV. The data sample was collected in 2016 and corresponds to an integrated luminosity of  $35.9\text{fb}^{-1}$ . Final states studied for TT production include those where one of the T quarks decays via  $T \rightarrow tZ$  and the other via  $T \rightarrow bW$ ,  $tZ$ , or  $tH$ , where H is a Higgs boson. For the BB case, final states include those where one of the B quarks decays via  $B \rightarrow bZ$  and the other  $B \rightarrow tW$ ,  $bZ$ , or  $bH$ . Events with two oppositely charged electrons or muons, consistent with coming from the decay of a Z boson, and jets are investigated. The number of observed events is consistent with standard model background estimations. Lower limits at 95% confidence level are placed on the masses of the T and B quarks for a range of branching fractions. Assuming 100% branching fractions for  $T \rightarrow tZ$ , and  $B \rightarrow bZ$ , T and B quark mass values below 1280 and 1130 GeV, respectively, are excluded. 7copy; CERN for the benefit of the CMS collaboration 2019. © 2019 Springer New York LLC.
