Cropping in progress

This stack is being cropped on our servers and may not be able to be shown right now.

Depending on the size and how many other images are currently being processed, this can take quite some time (many minutes).

To check, you can refresh the page.

No clear separation can be seen between:

- Hamate and capitate
- Trapezium and trapezoid
- Pisiform and triquetrum

Case Discussion

Carpal coalitions are typically asymptomatic but can rarely result in wrist pain. Syndromic-associated fusions are quite often multiple in nature¹, although in our case no definite syndrome has been diagnosed.
