In the present study, optimizing critical nutritional constituents was attempted as a primary strategy to improve biosurfactant production from *Klebsiella pneumoniae* WMF02 in liquid state fermentation utilizing sludge palm oil as a substrate. One-factor-at-a-time (OFAT) optimization was employed to evaluate the effects of sludge palm oil (SPO), sucrose, MgSO₄, FeSO₄, NaNO₃ and K₂HPO₄ on surface tension reductivity. Sucrose was selected as a co-substrate over glucose in the production media. The optimal levels of the aforementioned variables were (g/l) sucrose 5.0, MgSO₄ 0.4, FeSO₄ 0.3, NaNO₃ 2.0, and K₂HPO₄ 4.0, with SPO concentration of 4% (v/v). The optimized medium shows surface tension reduction from 36.2 mN/m (non-optimized medium) to 25.70 mN/m.
